TABLE OF CONTENTS

01 INTRODUCTION

Reviews on websites:

As simple it sounds; but it has a significant impact on how tourists choose their accommodation. It is vital for hotels to have reputation for quality and it would work as trustable verification for the hotel quality. A recent Barclays study showed there is potential of an extra £3.2 billion, by just paying more attention to online reviews. The dataset that was collected from Booking.com.

The goal is to:

Build unsupervised (NLP) machine learning models that decide whether a text review is positive review or negative review.

Project target costumers:

(Local business such as hotels, restaurants, coffee shops...)Benefit hotels to determine the category of text review and cluster them automaticity to improve their services.
